EDI 270/271 Eligibility — Design · 2026-08-13 · what you'll hear in documents/construction-replay.mp4

What this interface does

Clinic front desk verifies member eligibility over real X12 270/271 (005010X279A1): build a 270, call a mock payer, parse the 271, and show AAA rejection theater then a successful EB benefits response. Demo only — not a real payer.

Who it's for

- Sources: Clinic Web UI posts EligibilityRequest XML
- Destinations: sync X12 270, mock-payer 271, clinic JSON summary; audit files under output/
- Demo vs production: Demo only — canned AAA/EB, no SNIP, no clearinghouse
- Anyone watching the construction video or reading this transcript

Systems involved

- Sources: Clinic Web UI posts EligibilityRequest XML
- Destinations: sync X12 270, mock-payer 271, clinic JSON summary; audit files under output/
- Demo vs production: Demo only — canned AAA/EB, no SNIP, no clearinghouse

Documents we also produce

EDI270_271_Eligibility_Capability_Brief.pdf · ready

Short overview of what the interface does — shareable without reading route XML.

EDI270_271_Eligibility_Test_Plan.pdf · ready

Scenarios that prove the interface works end-to-end.

Module documentation pack (10 deep-dive PDFs) · ready

PilotFish product PDFs for the modules used in this build.

EDI270_271_V2_Route_Diagrams.pdf · ready

V2 route diagrams for visual review of module topology.

construction-replay.mp4 + this transcript · generate when ready

Narrated walkthrough of building the routes, then a live Demo-tab test when inject is available.

Narration

Spoken lines from the construction video (setup, build-replay, live test, closing).

Setup

Welcome

Welcome to the PilotFish demo: EDI 270/271 Eligibility. Clinic front desk verifies member eligibility over real X12 270/271 (005010X279A1): build a 270, call a mock payer, parse the 271, and show AAA rejection theater then a successful EB benefits response. PilotFish supports the whole flow out of the box.

Pipeline overview

Before we wire anything, here's the flow end to end. Clinic front desk verifies member eligibility over real X12 270/271 (005010X279A1): build a 270, call a mock payer, parse the 271, and show AAA rejection theater then a successful

EB benefits response.

External systems

And here's what sits around the routes. Mock Payer, PilotFish eiPlatform, and Demo Web UI. All of those are spun up in docker images for this demo.

1 - Eligibility 270 271 API

First route

Clinic front desk verifies member eligibility over real X12 270/271 (005010X279A1): build a 270, call a mock payer, parse the 271, and show AAA rejection theater then a successful EB benefits response. Starting with a blank canvas on the first route.

Eligibility REST

First up is a REST listener — clinic systems POST to /eip/rest/eligibility. The resources are build and parse. We wait for the route to finish so the caller gets an HTTP response back.

Snapshot Inbound Body

Next we archive a copy of the body — original name plus a timestamp. That lands under /opt/pilotfish/output/requests.

Conditional Router

Then a conditional router. POST to build goes down the 270 path, parse goes down the 271 path, and anything else is a 405.

Map Request To 270 EDI XML

Now for the mapping — we're using the stock XSLT processor with transform-request-to-270-edi-xml.xslt. It maps payerIdSafe, traceSafe, dateSafe.

Snapshot Raw 271

Then we write the X12 text to disk. That lands under /opt/pilotfish/output/271.

Empty Error Body

Now for the mapping — we're using the stock XSLT processor with transform-method-not-allowed.xslt.

Pretty-Print 270 EDI XML

This processor pretty-prints the XML — line breaks and indent — so the file on disk is readable.

Map 271 Wire To JSON

Now for the mapping — we're using the stock XSLT processor with transform-271-xml-to-json.xslt. Watch the for-each over ebSegs. It maps memberId, last, first.

Set 405

We set the HTTP status to 405 Method Not Allowed.

Write 270 EDI XML

Then we write that XML to disk so we can inspect it. That lands under `/opt/pilotfish/output/270`.

Write JSON Summary

Then we write the JSON summary to disk. That lands under `/opt/pilotfish/output/responses`.

405 Headers

We set the response content type so the clinic client knows what it got back.

XML to EDI 270

Here's the EDI transformation — it turns our EDI XML into X12 text on the wire.

Set 200 Parse

We set the HTTP status to 200 OK.

Method Not Allowed

This transport replies on the original REST call with whatever body we just built.

Write 270 EDI Wire

Then we write the X12 text to disk. That lands under `/opt/pilotfish/output/270`.

JSON Response Headers

We set the response content type so the clinic client knows what it got back.

Set 200 Build

We set the HTTP status to 200 OK.

Return Summary

This transport replies on the original REST call with whatever body we just built.

270 Response Headers

We set the response content type so the clinic client knows what it got back.

Return 270

This transport replies on the original REST call with whatever body we just built.

Closing

Demo complete

That's the demo — clinic front desk verifies member eligibility over real X12 270/271 (005010X279A1): build a 270, call a mock payer, parse the 271, and show AAA rejection. Thanks for choosing PilotFish.
