

EDI 270/271 — Orig vs Realtime

Same clinic story (FAIL001 AAA theater, then OK001 active benefits). Different ownership of the round-trip.

	Orig (edi-270-271-eligibility)	Realtime (this demo)
Clinic HTTP calls	Three: /build → payer → /parse	One: /eligibility/check
Who calls the payer	Clinic Web UI	PilotFish HttpPost
Sync reply	Synchronous Response transport	Synchronous Response processor after PostProcessors
Best for	Teaching the wire steps	Production-shaped real-time integration
Ports	8106 / 8107 / 8210	8120 / 8121 / 8211

Both demos use the same mock payer theater (AAA 72 / AAA 75 / active EB) and the same structural 271 parse. Realtime keeps that parse inside PilotFish after the HTTP Post returns.
