EDI 270/271 Realtime Eligibility — Design · 2026-08-13 · what you'll hear in documents/construction-replay.mp4

What this interface does

Clinic (or EHR) posts once. PilotFish owns the full synchronous 270 to payer to 271 round-trip and returns clinic-ready JSON on the same HTTP request.

Who it's for

- Sources: Clinic Web UI posts EligibilityRequest XML to PilotFish /eip/rest/eligibility/check
- Destinations: mock payer X12 271; clinic JSON summary; audit files under output/
- Demo vs production: Demo only — canned AAA/EB, no SNIP, no clearinghouse
- Anyone watching the construction video or reading this transcript

Systems involved

- Sources: Clinic Web UI posts EligibilityRequest XML to PilotFish /eip/rest/eligibility/check
- Destinations: mock payer X12 271; clinic JSON summary; audit files under output/
- Demo vs production: Demo only — canned AAA/EB, no SNIP, no clearinghouse

EDI270_271_Realtime_Capability_Brief.pdf · ready

Short overview of what the interface does — shareable without reading route XML.

EDI270_271_Realtime_Test_Plan.pdf · ready

Scenarios that prove the interface works end-to-end.

Module documentation pack (14 deep-dive PDFs) · ready

PilotFish product PDFs for the modules used in this build.

EDI270_271_Realtime_V2_Route_Diagrams.pdf · ready

V2 route diagrams for visual review of module topology.

construction-replay.mp4 + this transcript · generate when ready

Narrated walkthrough of building the routes, then a live Demo-tab test when inject is available.

Narration

Spoken lines from the construction video (setup, build-replay, live test, closing).

Setup

Welcome

Welcome to the PilotFish demo: EDI 270/271 Realtime Eligibility. Clinic (or EHR) posts once. PilotFish supports the whole flow out of the box.

Pipeline overview

Before we wire anything, here's the flow end to end. Clinic (or EHR) posts once.

External systems

And here's what sits around the routes. Mock Payer, PilotFish eiPlatform, and Demo Web UI. All of those are spun up in docker images for this demo.

1 - Realtime Eligibility Check

First route

Clinic (or EHR) posts once. Starting with a blank canvas on the first route.

Realtime Eligibility REST

First up is a REST listener — clinic systems POST to `/eip/rest/eligibility`. The resources are check. We wait for the route to finish so the caller gets an HTTP response back.

Snapshot Inbound Request

Next we archive a copy of the body — original name plus a timestamp. That lands under `/opt/pilotfish/output/requests`.

Conditional Router

Then a conditional router. POST to check takes the realtime round-trip; anything else is a 405.

Map Request To 270 EDI XML

Now for the mapping — we're using the stock XSLT processor with `transform-request-to-270-edi-xml.xslt`. It maps `payerIdSafe`, `traceSafe`, `dateSafe`.

Empty Error Body

Now for the mapping — we're using the stock XSLT processor with `transform-method-not-allowed.xslt`.

Pretty-Print 270 EDI XML

This processor pretty-prints the XML — line breaks and indent — so the file on disk is readable.

Set 405

We set the HTTP status to 405 Method Not Allowed.

Write 270 EDI XML

Then we write that XML to disk so we can inspect it. That lands under `/opt/pilotfish/output/270`.

405 Headers

We set the response content type so the clinic client knows what it got back.

XML to EDI 270

Here's the EDI transformation — it turns our EDI XML into X12 text on the wire.

Method Not Allowed

This transport replies on the original REST call with whatever body we just built.

Write 270 EDI Wire

Then we write the X12 text to disk. That lands under `/opt/pilotfish/output/270`.

Post 270 To Payer

Then we HTTP POST the 270 to the payer at `http://mock-payer:8210/x12/270`. After the response comes back, post-processors keep going on that same transaction.

Snapshot Raw 271

Then we write the X12 text to disk. That lands under `/opt/pilotfish/output/271`.

Save Raw 271

We keep the raw 271 on the transaction so we can wrap it without losing the wire text.

Wrap 271 For Parse XSLT

We wrap the raw 271 in a tiny XML envelope so the parse stylesheet can read it.

Load Wrapped 271 Body

Then we put that wrapped XML back on the body so the next XSLT can parse it.

Map 271 Wire To JSON

Now for the mapping — we're using the stock XSLT processor with `transform-271-xml-to-json.xslt`. Watch the for-each over `ebSegs`. It maps `memberId`, last, first.

Write JSON Summary

Then we write the JSON summary to disk. That lands under `/opt/pilotfish/output/responses`.

Set 200 Check

We set the HTTP status to 200 OK.

JSON Response Headers

We set the response content type so the clinic client knows what it got back.

Return Summary To Clinic

This processor replies on the original REST call, so the clinic gets the JSON on the same request.

Closing

Demo complete

That's the demo — clinic (or EHR) posts once. Thanks for choosing PilotFish.
