

# Construction Narration Pronunciation

Generated 2026-08-12 from construction-narration-pronunciation.json · Used by tools/construction\_speech.py when exporting construction-replay.mp4

How PilotFish Sandbox construction videos should pronounce technical terms and paths. Display text (transcript/PDF overlay) stays normal; TTS speech is rewritten from these rules.

**Display vs speech:** transcripts and overlays keep normal spelling (SFTP, /opt/...). Only the TTS voiceover is rewritten.

## 1. Paths — never say “slash”

**never say slash.** True

**unix path speak.** Speak folder segments as words separated by short pauses (commas). Example:  
/opt/pilotfish/input/staged → opt, pilotfish, input, staged.

**prefer friendly folder.** When a well-known env folder is meant, prefer the role name in speech: staged folder, archive folder, upload folder — and only spell the full path when the exact location matters.

**file extensions.** Leading dot extensions: say 'dot' then spell the letters. Example: .csv → dot C S V.

### Friendly folder phrases

| Path / fragment                      | Say                              |
|--------------------------------------|----------------------------------|
| /opt/pilotfish/input/staged          | the staged input folder          |
| /opt/pilotfish/output/archive        | the archive output folder        |
| /opt/pilotfish/output/staged-archive | the staged-archive output folder |
| input/staged                         | the staged input folder          |
| output/archive                       | the archive folder               |

## 2. Term pronunciation

| Match          | Say                  | Notes                                                                                              |
|----------------|----------------------|----------------------------------------------------------------------------------------------------|
| csv-to-sqlxml  | C S V to S Q L X M L | Demo stylesheet basename without extension.                                                        |
| sftp           | S F T P              | Always letter-by-letter. Never 'sift-p' or 'sftp' as one word.                                     |
| ftp            | F T P                | Letter-by-letter. Case-sensitive match avoids 'ftp' inside other words when lowercased separately. |
| ssh            | S S H                |                                                                                                    |
| jsch           | J S C H              | PilotFish encrypted SFTP library.                                                                  |
| jdbc           | J D B C              |                                                                                                    |
| sqlxml         | S Q L X M L          | Spell fully; do not say 'sequel XML'.                                                              |
| sql-server     | sequel Server        | Product name uses 'sequel'.                                                                        |
| sqlserver-host | sequel Server        | Docker service / hostname for SQL Server — do not letter-spell.                                    |
| sql            | sequel               | Standalone SQL → sequel. Applied after SQLXML / SQL Server rules.                                  |
| csv            | C S V                |                                                                                                    |
| xml            | X M L                |                                                                                                    |
| xslt           | X S L T              |                                                                                                    |

|            |                               |                                       |
|------------|-------------------------------|---------------------------------------|
| xpath      | X Path                        |                                       |
| json       | jay son                       |                                       |
| api        | A P I                         |                                       |
| http       | HTTP→H T T P, HTTPS→H T T P S |                                       |
| eiplatform | E I Platform                  |                                       |
| eiconsole  | E I Console                   |                                       |
| ognl       | O G N L                       |                                       |
| fqcn       | fully qualified class name    |                                       |
| dbo        | D B O dot                     | Schema qualifier before a table name. |
| localhost  | local host                    |                                       |
| uuid-ish   | module id                     | Do not read UUID hex aloud.           |

### 3. Examples (display → speech)

**Display:** Connects to SFTP host sftp, port 22, folder upload.

**Speech:** Connects to S F T P host sftp, port 22, folder upload.

**Display:** Writes to /opt/pilotfish/input/staged.

**Speech:** Writes to the staged input folder.

**Display:** Uses stylesheet csv-to-sqlxml.xslt on Saxon.

**Speech:** Uses stylesheet C S V to S Q L X M L dot X S L T on Saxon.

**Display:** JDBC to sqlserver, database CsvSftpDemo.

**Speech:** J D B C to sequel Server, database Csv Sftp Demo.

### 4. Agent workflow

1. Keep build-replay **detail** human-readable.
2. **tools/construction\_speech.py** rewrites lines for TTS when exporting video.
3. Edit **docs/construction-narration-pronunciation.json** to add terms; re-run this PDF exporter.
4. Re-export **construction-replay.mp4** so voiceover picks up the change.
