

EDI 270/271 Eligibility Demos

Original (edi-270-271-eligibility) vs Realtime (edi-270-271-realtime)

Prepared for Gary Beatty — real-time eligibility inquiry / response demo

Why two demos?

Both demos exchange **real X12 270 eligibility inquiries** and **271 eligibility responses** (005010X279A1) with AAA reject and active-benefits theater. The original demo is already synchronous HTTP, but the **Clinic Web UI orchestrates three HTTP calls** (PilotFish build → payer → PilotFish parse). Gary asked for a **real-time** eligibility demo; the new sibling puts **PilotFish in charge of the entire round-trip on a single sync REST call** — the shape you would deploy behind an EHR or front-desk system.

Side-by-side

Topic	Original demo	Realtime demo (new)
Folder	edi-270-271-eligibility	edi-270-271-realtime
Clinic HTTP calls per check	3 — PF /build → mock payer → PF /parse	1 — PF /eligibility/check
Who calls the payer?	Clinic Web UI (Flask)	PilotFish HttpPostTransport
How sync reply works	SynchronousResponseTransport on build & parse targets	HttpPost + PostProcessors + SynchronousResponseProcessor (Keycloak callout pattern)
Best audience	Teaching wire steps; showing each hop distinctly	Production-shaped real-time integration / sales demo for Gary
Ports (host)	EIP 8106 · UI 8107 · Payer 8210	EIP 8120 · UI 8121 · Payer 8211
Same in both	Real X12 270/271 · FAIL001 AAA · OK001 EB benefits · audit files under output/	Same presets, transforms, and mock-payer theater

Realtime flow (new)

- 1 Clinic POSTs EligibilityRequest XML to PilotFish.
- 2 PilotFish maps to EDI XML → XML→EDI **270** wire.
- 3 PilotFish **HttpPost** sends the 270 to the mock payer.
- 4 271 response continues in route PostProcessors → structural XSLT → clinic JSON.
- 5 SynchronousResponseProcessor returns that JSON on the original clinic HTTP request.

Original flow (unchanged sibling)

- 1 UI → PF /build → returns 270.
- 2 UI → mock payer → returns 271.
- 3 UI → PF /parse → returns JSON.

Demo script for Gary

Bring up edi-270-271-realtime (http://127.0.0.1:8121/ or LAN http://192.168.68.52:8121/). Run FAIL001 then OK001. Point at the single elapsed-ms figure and the

route PDF showing HttpPost in the middle of the sync chain. Optionally open the original demo on :8107 to contrast the three-step wire panel.

Sandbox honesty: both demos use a local mock payer and the same 23R1 trial-table workarounds documented in DESIGN.md. Swap PAYER_X12_URL for a clearinghouse endpoint when ready for a live payer pilot.
