

Interface Capability Brief

EDI 837 Claim Scrub — pre-clearinghouse rejection reduction · Stakeholder overview · 2026-08-07

1. Executive summary

EDI 837 Claim Scrub — pre-clearinghouse rejection reduction is a PilotFish demo interface that integrates systems using configurable listeners, processors, and transports. This brief summarizes what it can do today for stakeholders.

2. Who this is for

- SQL Server Edi837ClaimScrub — Claims, lines, patients, providers, PayerEditRules
- eiPlatform 23R1 — Poll → fork → payer-edit evaluate → router → kickout or EDI+SNIP
- Web UI :8115 — Inject claims, view kickouts / clean EDI / SNIP, review PDFs including test results

3. What the interface can do

Capabilities below are drawn from the working design and, when present, the published CapabilityStatement — not from aspirational roadmap items.

Integration highlights

Stage	Module	Notes
R1 Poll	DatabaseSqlListener + SelectClaimsSQL.xml	Claim PENDING→PROCESSED; includes ReferringNpi
Handoff	EIPTransport	Trigger Scrub Claim And Route
Fork	Format Split Claims / XPathForkingModule	`//CLAIM \
Evaluate	XSLTProcessor transform-evaluate-payer-edits.xslt	Synthetic payer profile (mirrors PayerEditRules)
Router	XPathRoutingModule on //MatchBucket	kickout vs clean
Kickout	DirectoryTransport → output/kickouts/	Decision XML (human summary + reasons)
BI	DirectoryTransport → output/bi/	Same decision for both buckets
Clean	EDI XML → EDITransformationProcessor (TableData 837-Q1) → EDI file → SNIP 1–3	output/edi, output/snip

4. Honest boundaries (not claimed yet)

- Production hardening (HA, disaster recovery, full audit workflows) is outside this demo brief
- Anything not listed in §3 should be treated as future work unless confirmed in DESIGN.md

5. What you can verify in a walkthrough

Use these as checklist items when reviewing the demo with business stakeholders. They describe outcomes, not module names.

- Exercise route “1 - Poll SQL Server Claims” from the Web UI or documented smoke path

-
- Exercise route “2 - Scrub Claim And Route” from the Web UI or documented smoke path
 - Confirm outputs land in the documented folders / queues and appear in the Web UI status views

6. How it works (plain language)

Routes in this interface

Each route is a configured PilotFish flow. Technical wiring appears in the Route Diagrams PDF; here is the stakeholder reading.

1 - Poll SQL Server Claims: runs steps such as Poll SQL Server Claims, Write Raw Claims Snapshot, Conditional Router, Hand Off Claims.

2 - Scrub Claim And Route: runs steps such as Scrub Claim And Route.Programmable (Trigger) Listener, Fork - XPath, Conditional Router, Read Claim Keys.

7. Security & trust posture

- X12 SNIP validation is used where configured to reject bad EDI before downstream work
- Risk noted in design: Med — Payer rules duplicated in XSLT (not live SQL join) — UI reads PayerEditRules; DESIGN calls out dual source
- Risk noted in design: Med — Claim marked PROCESSED before scrub completes — Same claim-before-complete demo pattern as base 837
- Risk noted in design: Low — SNIP does not re-route to kickout — SNIP runs only on clean path; stop-on-error false
- Risk noted in design: Low — Large heap for SNIP — CATALINA_OPTS 6GB

8. Seeing it work

- docker compose up -d --build
- - Local UI: <http://localhost:8115/>
- - EIP: <http://localhost:8114/eip/>
- - Capability: <http://localhost:8115/documents/capability-brief.pdf>
- - Route diagrams: <http://localhost:8115/documents/route-diagrams.pdf>
- - Test plan: <http://localhost:8115/documents/test-plan.pdf>
- - Test results: <http://localhost:8115/documents/test-results.pdf>
- curl -sS <http://localhost:8115/api/health>
- curl -sS <http://localhost:8115/api/kickouts> | head
- curl -sS <http://localhost:8115/api/edi> | head

9. Related technical documents

- DESIGN.md — working engineering specification for this interface
- README.md — how to run, ports, and smoke commands
- EDI837_Claim_Scrub_V2_Route_Diagrams.pdf — detailed PilotFish route wiring diagrams
- This Capability Brief — shareable stakeholder summary (regenerate after design changes)

This document is generated from the interface sources listed above. If design and runtime diverge, believe the smoke-tested runtime and update DESIGN.md.
